C-CORE 1.3 Historic records for surface currents

Historic records for surface currents

Challenge

Challenge ID	C-CORE_OFF1.3
Title	Historic records for surface currents
Challenge originator:	
General Description	
What data/products do you use?	Historical ocean surface currents data are available via different agencies. They are either based on reanalysis, hindcast model data or derived from satellite observations.
	Data from Global models: HYCOM+NCODA model system Three Global reanalysis from MERCATOR, University of Reading and CMCC via MyOcean Data from regional models: Mediterranean Sea: MEDSEA (MyOcean) Iberian, Biscay and Irish Seas: IBI MFC model, limited in time European NW Shelf
	Currents derived from satellite: Global geostrophic currents analysis from MyOcean derived from satellite observations: Global geosptrophic currents from NOAA: derived from sea surface height, wind speed and sea surface temperature satellite observations Historical ocean surface current data are used to great extent in all phases
	throughout the O&G cycle, except strictly operational tasks. The data set is used to assist in qualifying and quantifying the means and extremes of ocean currents in the area of interest. In addition ocean data are important for environmental impact studies, oil spill trajectory modeling, modeling of drilling cuttings etc.
When do you use this kind of dataset?	During the early stages, field assessment/seismics etc. the data are mostly used to assess the operability of the area during different seasons and to assess financial risk and first draft of development costs. During planning of new fields and operations data are used to assess the climatic limitations local/regional weather would have on safety in order to reduce risk for operations, personnel and environment.
	Finally surface current data are important to design of structures that can withstand the local conditions and take into account the risk of the extreme situations of the area.

Information	
Technology Urgency	Short term (2-5 years)
Activity impacted /concerned	
Topographic classification / Offshore classification	Ocean
restrictions	Seasonality: Applies to all seasons.
Geographic context/	Applies to all six areas of interest, except for the cautionary notes about tropical cyclones, which only applies to South China Sea, West of Ireland, and Myanmar.

Needs and expectations on EO data	Long (10 years +) observed time series of high quality (ground-truthed) and with high spatial resolution, especially for coastal areas and emerging O&G areas where demand for such data has been small or non-existent. Or - EO data that can improve modeled reanalyses. Specific need: Long time series of ocean current data.
	EO is used for this today, but resolution, update frequency, length of data series and quality is not sufficient for instance design studies. It is used as input in regional reanalysis and hindcast.
What are your actual limitations and do you have a work around?	of extreme values very challenging (e.g., most extremes at sea were probably not observed or sampled). Update frequency: Generally to slow, and not extended to real-time. And observations for "patching" often not available. Temporal resolution: Not by far sufficient, often daily snapshots, and averages, does not catch important events. Spatial resolution: Not by far sufficient, should have at least 4 km resolution to resolve small scale features and coastal areas. NOTE. High resolution and high update resolution does not equal quality, hence documentation of verification is equally important!
	Same as for wind and wave, only that data of sufficient quality is rare. Most of this is due to the limited access to observations, and if accessible available update frequency, quality and resolution is normally poor. Little data is available to sufficiently ground truth EO data. In addition data of sufficient quality can be hard to come by in coastal and remote/less developed areas. Modelled data has low quality for on shorter time scales, while climatology is of sufficient quality. These data rarely catch short lived and small scale extremes. There are important spatial and temporal limitations of historical surface-based and remotely-sensed ocean current observations that make the analyses

	Daily or weekly, since historical data is frequently required to assess recent
Update frequency	events. For some parameters and data sets, monthly is still sufficient.
	Available today:
	For the historical reanalyses and archived observations, monthly; however,
	recent observations are available generally without delay.
Temporal resolution	Data should be at least 1-3 hourly resolution depending on area and
	phenomena needed to be resolved.
	A 1.11. (. 1
	Available today:
	OSCAR: 5-day moving mean.
	HYCOM+NCODA system: Daily snapshot at 00Z
	MyOcean global reanalysis: Monthly (all), weekly (MERCATOR), daily
	(CMCC) from 1993
	Regional models:
	Mediterranean Sea: MEDSEA (MyOcean): Monthly, daily from 1987
	Iberian, Biscay and Irish Seas: IBI MFC model: Daily means (and hourly
	means) from 20110401
	European NW Shelf: FOAM: Daily means from 1985
	10077 1 1 10 10
	Currents, temperature and SST derived from satellite:
	Global geostrophic currents and SST analysis based on satellite observations:
	Weekly and monthly means Around 4 km, maybe less in coastal areas.
	Around 4 km, maybe less in coastal areas.
Spatial resolution	Available:
	OSCAR: 1/3°
	HYCOM+NCODA system: 1/12°
	MyOcean global reanalysis: 0.25°
	Regional models:
	Mediterranean Sea: MEDSEA (MyOcean) :6-7 km
	Iberian, Biscay and Irish Seas: IBI MFC model: ~2km
	European NW Shelf: FOAM: 7 km
	Currents, temperature and SST derived from satellite:
	Global geostrophic currents and SST analysis based on satellite observations:
	1/4°
	The selected sources in this document are selected because they are known to
	have sufficient quality (after some work-around/adaptation). In general
	separate in-depth verification studies has to be made for each source planned
	to be used for analysis, and the analysis has to be repeated for each
Data quality	geographical area (since sources might be of sufficient quality in one area but
	not another).
	In general, ground observations and modelled sourced are perceived to be of
	better quality than EO for historical current data.
Data Coverage and	D
extent	Regional
Example format	CSV and/or netCDF
Timeliness	Normally needed urgently, possibly before assessing, planning, or exploring
	a new field. Hence the data source used for analysis needs to be frequently
	updated to avoid unnecessary waiting. Daily, weekly or monthly updates of
Existing standards	data sets are sufficient, depending on the analysis required.
