Hatfield-4207: Understanding and predicting changes in hydrological processes

Understanding and predicting changes in hydrological processes

Challenge

Challenge ID: HCP-42	07	Originator:	Onshore: Hatfield	
	Understanding and predicting changes in hydrological processes.			
	ON 4.2: Environmental monitoring - Continuous monitoring of changes throughout the lifecycle			
Consortium Lead: Hatfield		Interviewed Company:	Hatfield	
Geography: ON.RE	ON.REG.03 - Canada			
Challenge Description				
What is not possible / not adequately addressed at present?				
There is a need to understand surface hydrology within the project area, including catchments and watersheds, sheet flows on plains, seasonal characteristics of ephemeral drainage systems (wadis and lakes), buried / infilled valleys, and marsh / bog detection. Development may create changes in water flows by isolating certain areas hydrologically, changing drainage patterns, and clearing vegetation.				
What effect does this challenge have on operations?				
Early identification of constraints and opportunities, reduces project uncertainty, and improves decision making for field development. Understanding disturbance within catchments for modelling and predicting potential impacts of development on surface hydrology and stream discharge.				
Thematic information				
requirements:	Land use			
	Terrain information			
	Topographic information			
	Water quantity			
Ortho base images				
What do you currently do to address this challenge? How is this challenge conventionally addressed?				
Aerial photographic interpretation and support from field mapping, walkover surveys and fly-by surveys is also				
performed. Hydrological monitoring and modelling.				
What kind of solutions do you envisage could address this challenge?				
LiDAR can help to identify drainage in densely vegetated areas where surface cannot be observed.				
Improvements to thermal imaging. Distributed hydrological models.				
What is your view on the capability of technology to meet this need?				
Are you currently using EO tech? If not, why not?				
Improved DEMs. EO can complement ground-based and airborne techniques and provide wider geographic				
coverage at lower cost.				
Challenge Classification				
Impact on Lifecycle (0=none, 4=high):		Climate / Topography / Urgency:		
Pre-license:	2	Climate class:	Generic climate	
Exploration:	2	Topographic c	elass: Not specific	
Development:	4	Seasonal varia	tions: Warmer weather focus	
Production:	3	Impact area:	Health and Safety Cost reduction	
Decommissioning:	2	Technology un	rgency: 3 - Immediately (0-2 years)	
Challenge Information Requirements				

Update frequency:	Snapshot to annually		
Data currently used:	Visual assessment of vegetation and understory by field crews. Air photo interpretation DEM analysis (ASTER, SRTM, High res optical DEM)		
	Google Earth		
Spatial resolution:	Regional to License		
Thematic accuracy:	Not specific		
Required formats:	Not specific		
Timeliness (Vintage):	Reference data		
Geographic extents:	License		
Existing standards:	None
